question is to get you used to using multiple terminals and the man page. This is a skill need for the final exam so please do not use the internet to find the answers. Make sure to take a screenshot of every command that answers each question. The screenshot needs to show the man page of the given command open in the location where you found the answer and it has to show the command and its output.
1 John wants to see how much free memory he has in his system. He understands that the free command is used for this however, he would like the output of the command to appear in a single line and with human readable format.
a What is the complete command that John has to use here?
b Take a screenshot showing the man page showing the correct options and the command and its output. See the example for a reference.
2 Kenny is a system administrator working on automation scripts. He is building a script where he needs to know the kernel name, kernel release, kernel version, and operating system of the computer. He knows that the uname command can provide this information.
a What is the complete command that Kenny has to use here?
b Take a screenshot showing the man page showing the correct options and the command and its output. See the example for a reference.
3 Dave is working with an API that only accepts rfc-3339 time format for dates. For example, 2025-09-10 18:39:53.467197335-04:00 is an acceptable format but anything else will return an error. He needs a date command that will allow him to convert the current time into rfc-3339 format.
a What is the complete command that Dave has to use here?
b Take a screenshot showing the man page showing the correct options and the command and its output. See the example for a reference.
Here is an example question and solution so that you know what I am expecting of you:

Here is an example question and solution so that you know what I am expecting of you:
Example question
1 Julius has a homelab with tailscale. His homelab has several Linux containers and he wants a command that will display in JSON format the IP configuration for a machine when he signs in. He knows that the command ip addr show dev <interface> can be used for displaying the specific interface configuration but the output is not in JSON format and it is also hard to read.
a What is the complete command that Julius has to use here? (options for the ip command have to be placed after ip)
b Take a screenshot showing the man page showing the correct options and the command and
